

PRESS RELEASE

## MyDefence Expands the Frontline Against Drones with New Long-Range Jammer

**Aalborg, June 15, 2026.** As drones continue to reshape modern warfare, MyDefence is extending the reach of counter-drone protection and denying adversaries the airspace they seek to exploit.

Today, that space reaches further than ever before.

The Danish counter-drone company today launched Boxer. A multi-band electronic warfare system built to own the electromagnetic spectrum - the invisible terrain hostile drones depend on to fly, navigate, communicate, and strike. At up to 10 kilometres range - depending on RF environment, line of sight, and antenna type and height - Boxer pushes the fight further from the forces, assets, and infrastructure it protects.

*"Boxer is the most powerful jammer we have ever built. Whoever owns the spectrum owns the ground and Boxer makes sure that is us."* Said Dan Hermansen, CEO, MyDefence Group.

While drones dominate defence headlines, MyDefence has long argued that the decisive contest happens in thin air. Across the signals, links, and navigation channels that allow unmanned systems to function. Boxer is the answer to that contest. Prior to launch, Boxer has been fielded and tested in close collaboration with defence partners and shaped through real-world deployment.

### Technical Specifications

Operating across nine simultaneous frequency bands, Boxer severs the link between drone and operator. It disrupts autonomous navigation and neutralises flight management simultaneously, at scale, across terrain that no physical barrier could cover.

Designed for deployment at fixed sites or on vehicles, the system provides flexible protection for manoeuvre forces, forward operating bases, and critical infrastructure. It integrates seamlessly into existing military command networks without requiring operators to rebuild architecture already in theatre.

As NATO member states accelerate counter-drone procurement, the demand is clear: electronic warfare capability that is mobile, proven, and able to hold ground. Boxer holds up to 10 kilometres of it.

Boxer is available now for defence and security procurement.

### About MyDefence

MyDefence is a global counter-UAS technology company delivering detection and jamming solutions engineered for the most complex radio-frequency environments. Its systems are trusted by armed forces, law enforcement agencies, and critical infrastructure operators worldwide, providing end-to-end protection against the evolving drone threat.
